Sophos Central Mobile

A native iOS command center for Sophos Central — powered by AI, browser automation, and the Sophos Central API. Manage, investigate, and respond from your phone.

WHAT'S INCLUDED

AI-POWERED

AI Security Assistant

Groq-powered chat that knows your environment. Triage alerts, investigate incidents, get remediation guidance.

AUTOMATION

Playwright Backend

Headless browser automation for Live Discover, threat graphs, and policies — features the API can't reach.

INVESTIGATION

Threat Intel Enrichment

Look up hashes, IPs, and domains against VirusTotal and AbuseIPDB with auto-detection.

MANAGEMENT

Multi-Tenant Support

Manage multiple Sophos Central orgs. Switch tenants with one tap. Built for SEs and MSPs.

Clone the repo and run in Xcode: **github.com/madmatdev/Sophos-Central-Mobile-App** (branch: acosta-branch). Tap **Demo Mode** on the login screen to explore with realistic fake data — no tenant needed.

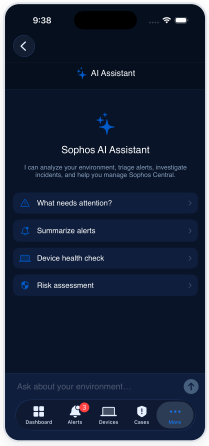
AI-POWERED

AI Security Assistant

A conversational security analyst powered by Groq's llama-3.3-70b model — automatically loaded with your current environment data for context-aware analysis and recommendations.



What the AI Assistant can do

- **Alert Triage** — "What needs attention?" analyzes all current alerts with severity ratings and prioritized recommendations.
- **Investigation** — "Why is PACS-IMAGING-1 compromised?" correlates alerts, device health, and MITRE ATT&CK patterns.
- **Remediation** — "How do I respond to CryptoGuard?" provides step-by-step incident response with specific endpoint actions.
- **Executive Summaries** — "Summarize this week for my manager" generates non-technical security status reports.
- **Live Discover Queries** — "Find running PowerShell processes" generates SQL queries you can execute directly.
- **Trend Analysis** — "Compare this week vs last" identifies patterns and emerging threats across your environment.
- **Threat Intel Context** — "What is Troj/Ransom-GKL?" explains threat behavior, impact, and recommended actions.

> **Setup:** Get a free API key at **console.groq.com**, paste it in Settings → AI Configuration. The assistant automatically loads your current alerts, devices, health scores, and cases as context.

Additional capabilities

- Smart Notifications with AI triage
- Siri Shortcuts (3 voice intents)
- Exclusion management (CRUD)
- Demo mode for customer demos
- iOS Widgets (small & medium)
- Watchlist for tracking items
- Firewall monitoring
- Offline caching (SwiftData)

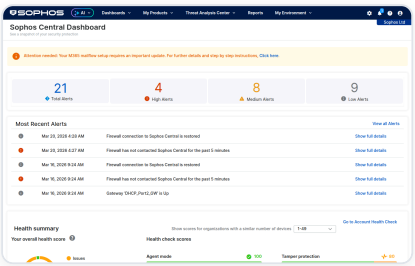
COVERAGE

API + Playwright: Beyond the Console

The Sophos Central API covers ~40% of the web console. Browser automation fills the other 60% — giving you mobile access to Live Discover, threat graphs, and policy management.



Live capture of Sophos Central dashboard via Playwright backend

Playwright Backend — Dockerized deployment

The Playwright backend runs as a Docker container on Mac, Windows, or Linux. It authenticates to Sophos Central's web console using a headless Chrome instance with built-in noVNC for the initial 2FA login.

1. **docker compose up** — builds and starts the container with Chrome, Node, and VNC pre-installed.
2. **Open localhost:6080** — noVNC web viewer shows the Chrome window. Complete your 2FA login.
3. **Press Enter** — session saves to disk. The backend switches to headless mode and serves the REST API.
4. **API ready** — screenshots, Live Discover, threat graphs, and policies available at port 18870.

> **Session persistence:** The browser session is saved to a Docker volume and survives container restarts. Re-login is only needed when the Sophos Central session expires (typically days).

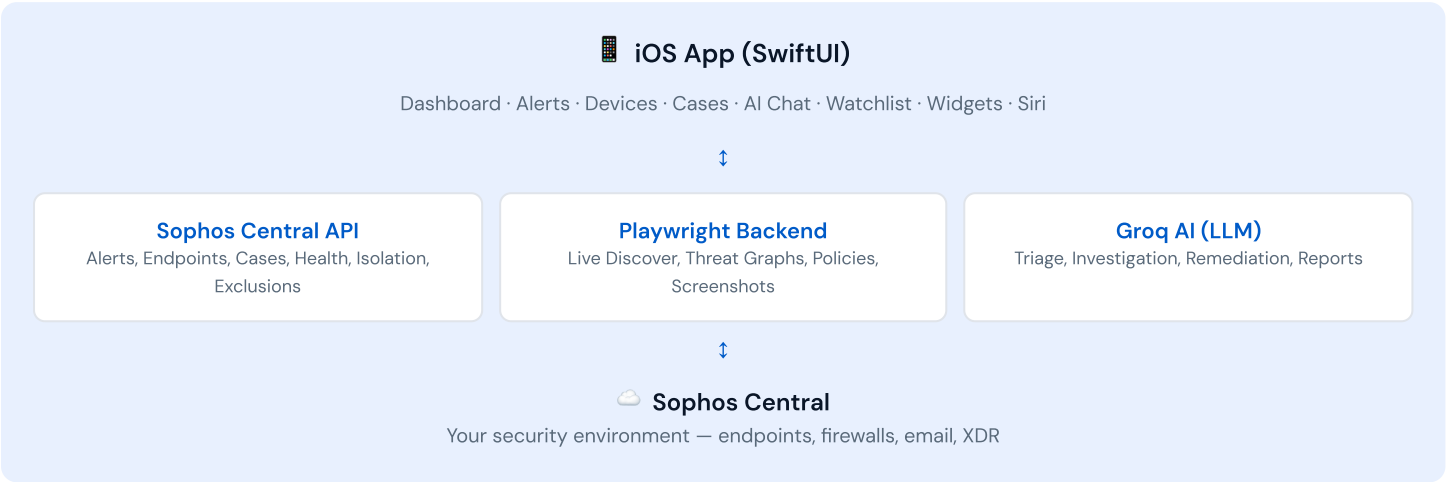
ARCHITECTURE

How It Works

Three layers working together — the Sophos API for data, Playwright for browser automation, and Groq AI for intelligence.



GETTING STARTED

Deploy in minutes

1. **Clone & Build** — `git clone` the repo, run `xcodegen generate`, open in Xcode, build for simulator or device.
2. **Start Playwright** — Run `docker compose up` in the playwright-backend folder. Open localhost:6080 for 2FA login.
3. **Configure AI** — Get a free Groq API key at console.groq.com. Paste in Settings → AI Configuration.
4. **Connect or Demo** — Enter Sophos Central API credentials, or tap **Demo Mode** for instant exploration with fake data.

Who it's for

- **SEs** — Demo to customers, multi-tenant management
- **SOC Teams** — Mobile triage and investigation
- **Admins** — Respond to incidents on the go
- **MSPs** — Multi-org visibility from one app

Technical requirements

- **iOS 18+** — SwiftUI, SwiftData, App Intents
- **Xcode 16+** with iOS 26 SDK for building
- **Docker** for the Playwright backend (Mac, Windows, or Linux)
- **Sophos Central** account with API credentials (Client ID + Client Secret)
- **Groq API key** (free) for the AI assistant — optional but recommended
